

Setting up the Shared folder on Ubuntu

1. Create a folder on the Host, i.e. We have windows on our system.
2. Go to virtual machine settings and add the path to the Shared folder

Our VirtualBox shared folder is configured as:

Setting	Value
Windows Folder Path	C:\Users\USER\Downloads\Data-set
VirtualBox Folder Name	Data-set

So the Folder Name we need to use in the VM is **Data-set**.

1. Run the command in the ubuntu terminal

```
sudo mount -t vboxsf synvh /mnt/shared
```

2. **Go to the /etc/fstab and add this line in the end**

```
synvh /mnt/shared vboxsf defaults,uid=1000,gid=1000,rw 0 0
```

After that we have to start the actual process of mounting the folder.

Step 1: Create the mount point

```
sudo mkdir -p /mnt/shared
```

Step 2: Mount manually (to test)

```
sudo mount -t vboxsf synvh /mnt/shared
```

Step 3: Check if it worked

```
ls /mnt/shared
```

You should see the files from C:\synvh on Windows

Step 4: If it works, make it permanent

```
echo "synvh /mnt/shared vboxsf defaults,uid=1000,gid=1000,rw 0 0" | sudo tee -a /etc/fstab
```

if you power off your Virtual Machine, the folder will never disappear from the Virtual Machine.

Step 5: Reload systemd and test

```
sudo systemctl daemon-reload
```

```
sudo mount -a
```
